Sudbury Joint Venture to Step-Up Exploration for

Cu-Pt-Pd-Au Footwall Deposits in 2005

TORONTO: January 13, 2005 **FNX Mining Company Inc. (FNX-TSX/AMEX)** and Dynatec Corporation (DY-TSX) announce that 53% of the planned drilling in the Sudbury Joint Venture's (SJV) \$11.4 million 2005 Exploration Budget will be allocated to explore for copper-platinum-palladium-gold (Cu-Pt-Pd-Au) deposits in the prospective footwall environments behind the SJV's Levack/McCreedy West Mine Complex located in the Sudbury District, Ontario and to explore for similar Cu-Pt-Pd-Au footwall deposits and nickel (Ni) contact deposits at the SJV's Podolsky Property. The remainder of the 2005 drill program will be utilized to increase and upgrade the McCreedy West and Levack resources and reserves and to assist in mine planning and production.

2004 Footwall Exploration Results

The 2004 FNX and historic drilling in the footwall environments behind the Levack Mine (Fig.1) have intersected favourable host rocks containing significant Cu-Pt-Pd-Au values. The 2004 FNX mineralized intersections (Table 1) range from 0.5 ft to 27.9 ft in core length and, together with the results of historic drilling (Table 2), indicate a strike length of 600 ft in the footwall behind the Levack #3 Orebody (Fig. 2) and 350 ft in the footwall behind the Levack Main Orebody (Fig.3). The Levack #3 Orebody footwall target area has associated off-hole borehole geophysical anomalies that have not yet been drill tested. Both target areas are open and warrant extensive additional drilling.

HIGHLIGHTS OF 2004 McCREEDY WEST and LEVACK FOOTWALL DRILLING

Hole No.	Ft.	Cu%	Ni%	Pt+Pd+Au g/T
6025	4.8	28.9	0.5	4.6
6029	27.9	20.6	1.0	5.1
incl	5.2	23.1	3.6	5.6
incl	15.7	29.0	0.5	7.2
6032A	1.3	18.9	9.1	10.5
6037	6.7	3.9	0.8	3.6
6031	25.0	1.1	0.3	4.0
6033	1.2	3.2	0.5	13.6

The footwall drilling results, to date, have not yet determined the continuity, orientation and significance of individual veins, however the SJV is very encouraged by the positive indications, especially the persistence of the high-grade Cu-Pt-Pd-Au vein systems over significant strike lengths in very favorable geological environments. These areas are also considered to be very favourable for no seum , low sulphidation type Cu-Pt-Pd-Au deposits.

The SJV s 2005 surface drilling program will focus on the footwall environments behind the McCreedy and Levack Mines and follow-up the successful 2004 exploration results with extensive drilling of high-priority footwall targets containing Cu-Pt-Pd-Au drill intersections, favourable geology and associated borehole geophysical anomalies.

Background

The Sudbury Basin Cu-Pt-Pd-Au footwall deposits are emplaced within zones of intense Sudbury Breccia and are usually situated behind or in the shadow of nickel-rich ore deposits at or near the basal contact of the Sudbury Intrusive Complex. Some of the best examples of this type of ore deposit are the SJV's McCreeedy West PM and Copper-vein Deposits behind the McCreeedy West nickel-rich contact deposits, Inco's McCreeedy East 153 and Falconbridge's Strathcona footwall deposits behind the McCreeedy East and Strathcona nickel-rich contact deposits and Falconbridge's Nickel Rim South deposits. The Nickel Rim South Cu-Pt-Pd-Au footwall deposit and its associated nickel-rich contact deposit were recently discovered by Falconbridge, who have published a Nickel Rim South resource of 13.7 million tonnes grading 1.7% Ni, 3.6% Cu and 5.0 g/T TPM. Falconbridge is currently putting the property into production at a net cost of US\$413 million.

The McCreeedy West and Levack Properties (Fig. 1) are located within the very productive Levack Embayment, which hosts over 16 producing or formerly producing mines containing over 250,000,000 tons of nickel-rich contact type ore. The eastern half of the Levack Embayment is held by Inco and Falconbridge and, in addition to hosting important nickel-rich deposits, also hosts several large, high-grade Cu-Pt-Pd-Au footwall-type deposits situated behind the nickel-rich contact deposits. Some of these deposits are situated significant distances away from the nickel deposits and the contact area. The SJV properties cover the western half of the Levack Embayment, which also hosts large, nickel-rich contact deposits, but no large Cu-Pt-Pd-Au footwall-type deposits similar to those discovered on the eastern portion of the Levack Embayment. However, the Cu-Pt-Pd-Au footwall mineralization discovered to date on the SJV's western half of the Levack Embayment (e.g. PM Deposit at McCreeedy West and high-grade, isolated drill intersections) clearly demonstrates the high potential for SJV's western part of the Levack Embayment to also host large, significant Cu-Pt-Pd-Au footwall-type deposits. Most of the SJV footwall mineralization discovered to date is behind the McCreeedy West Mine and is situated close to the contact area. Both the proximal footwall target areas and the more distal footwall environments away from the contact area have not been well explored on the SJV portion of the Levack Embayment and require extensive detailed drilling.

The SJV's Levack property has a very large zone of intense Sudbury Breccia in direct association with and behind the Levack Mine, which produced over 60 million tons of nickel-rich contact ore. No significant footwall type deposits have yet been discovered behind Levack's nickel-rich contact deposits. This may be due to the fact that, the Levack footwall and its Sudbury Breccia zone in this area have not been adequately explored. The limited but positive exploration conducted in this area to date, (i.e. sulphide intersections with grades and mineralogy that are typical of the footwall deposits), demonstrates the significant potential of the Levack mine footwall area. The FNX footwall exploration completed since acquiring the SJV properties (including surface mapping, geophysics and drilling along with the geological studies on the PM and Podolsky deposits) has provided a much better understanding of the prospective footwall environments and has led to the identification of prospective targets on the McCreeedy West, Levack and Podolsky properties.

The focus at the Podolsky Property in the 2005 Exploration Program is sinking the exploration shaft on the 2000 Deposit and the advanced underground exploration program leading to a feasibility study. However, much of the four kilometer contact and footwall environments at the Podolsky Property have not been adequately explored and the SJV

plans to test several very prospective targets on the property. These include both nickel-bearing targets at the base of the Sudbury Intrusive Complex and Cu-Pt-Pd-Au in the footwall and offset dyke environments.

Upgrading of nickel resources at McCreedy West Mine is currently being undertaken using closer spaced drilling within the Inter Main Deposit and step-out drilling to expand the limits of the Inter Main. This program, which was initiated in mid 2004, is meeting with success and will be aggressively pursued in the first half of 2005. Footage has been allocated for surface drilling to test the nickel bearing Boundary Deposit, which may be part of a down-dip extension of the currently producing Inter Main Deposit. The sparsely tested basal contact of the Sudbury Igneous Complex in the area between McCreedy West and Levack Mines is considered a large, favorable target area and will be tested in greater detail from underground locations.

The rehabilitation of the Levack #2 shaft is proceeding as planned and when underground access is available drilling will be conducted to upgrade Levack's audited measured and indicated nickel resources of 5.1 million tons grading 1.9% Ni and 0.9% Cu and inferred nickel resources of 1.0 million tons grading 2.0% Ni and 0.9% Cu (FNX News Release September 4, 2003).

Sudbury Joint Venture General

The Sudbury Joint Venture is owned 75% by FNX and 25% by Dynatec Corporation. The SJV properties (McCreedy West, Levack, Victoria, Podolsky (formerly Norman) and Kirkwood) are all former copper, nickel, platinum, palladium, gold producers located in the Sudbury District of northeastern Ontario and are covered by previously announced agreements between FNX and Dynatec (see February 3, 2002 FNX and Dynatec press release). For a detailed description of the properties and previous work, please go to the FNX website www.fnxmining.com and refer to FNX's Annual Information Form dated March 23, 2004.

James M. Patterson, Ph.D., P.Geo., and Vice President Exploration of FNX, is the designated Qualified Person and is responsible for the verification and quality assurance of the Sudbury Joint Venture's exploration data and analytical results. Please see the July 16, 2003 press release and the above referenced Annual Information Form for a description of sample preparation and assay procedures for the Sudbury Joint Venture. Dynatec is the mine operator for the Sudbury Joint Venture. Anthony P. Makuch, M. Eng., P. Eng., M.B.A., and Dynatec's Vice President, Sudbury Joint Venture Mining Operations, oversees mining activities on behalf of the Sudbury Joint Venture.

This news release contains certain forward-looking statements. These forward-looking statements are subject to a variety of risks and uncertainties beyond the company's ability to control or predict which could cause actual events or results to differ materially from those anticipated in such forward-looking statements. In this news release, statements about potential discoveries of footwall type deposits and 2005 budget forecasts are forward-looking statements. There is no guarantee that any discovery of commercial mineralization will be made on FNX Mining's properties or that the forecast budget will be spent. Accordingly, readers should not place undue reliance on forward-looking statements.
