The Basel Framework, based on the International Convergence of Capital Measurement and Capital Standards: A Revised Framework issued by the Basel Committee on Banking Supervision, requires the disclosure of capital adequacy information to ensure the enhanced effectiveness of market discipline. Our disclosure is made under the Matters Separately Prescribed by the Commissioner of the Financial Services Agency Regarding Capital Adequacy Conditions, etc. pursuant to Article 19-2, Paragraph 1, Item 5, Subitem (d), etc. of the Ordinance for Enforcement of the Banking Law (Ministry of Finance Ordinance No. 10 of 1982) (the FSA Notice No. 7 of 2014).

With respect to the calculation of capital adequacy ratio, we have applied the international standard and adopted (a) the advanced internal ratings-based approach as a method to calculate the amount of credit risk weighted assets and (b) the advanced measurement approach as a method to calculate the amount equivalent to the operational risk.

In calculating the consolidated capital adequacy ratio, we underwent an examination following the procedures agreed with Ernst & Young ShinNihon LLC, on the basis of Treatment in implementing examination by agreed-upon procedures for calculating capital adequacy ratio (Industry Committee Practical Guideline No. 30 of the Japanese Institute of Certified Public Accountants). Note that this is not a part of the accounting audit performed on our consolidated financial statements. This consists of an examination under agreed-upon procedures performed by Ernst & Young ShinNihon LLC on a portion of the internal control structure concerning the calculation of the capital adequacy ratio and a report of the results to us. As such, they do not represent an opinion regarding the capital adequacy ratio itself nor the internal controls related to the calculation of the capital adequacy ratio.

4. Estimated loss amount related to underlying assets is based on the amount of the underlying assets as of the relevant date and the following parameters that are used in the calculation of capital adequacy ratio:

parameters used in the calculation of required capital for an underlying asset when applying the supervisory formula (e.g., PD); and

with respect to underlying assets classified as securitization exposure, the conservative application of risk weights used in the ratings-based approach.

Table of Contents**n Market risk****Trading activities**

The following table shows VaR (Value at Risk) figures of our trading activities:

	For the six months ended September 30, 2013	For the fiscal year ended March 31, 2014	(Billions of yen) For the six months ended September 30, 2014
End of period	5.8	5.4	3.3
Maximum	7.0	7.4	6.8
Minimum	3.3	3.3	3.1
Average	5.4	5.7	4.1
The number of cases where assumptive losses exceeded VaR during the period	1	0	0

Notes:

1. Amount of market risk (VaR) is calculated based on the internal model.
2. The multiplication factor for the calculation of market risk equivalent is determined by the number of cases where assumptive losses exceeded VaR before 250 business days prior to the end of period.
3. Our group companies which conduct trading activities are Mizuho Bank, Mizuho Trust & Banking and Mizuho Securities, etc.

VaR method:

Linear risk:	variance co-variance model
Non-linear risk:	Monte-Carlo simulation
VaR	Simple aggregation of linear risk and non-linear risk
Quantitative standard:	1. confidence interval: one-tailed 99.0%; 2. holding period: 1 day; and 3. historical observation period of one year (265 business days)

VaR (Value at Risk)

The VaR method measures the maximum possible loss that could be incurred due to market movements within a certain time period (or holding period) and degree of probability (or confidence interval).

Back testing

The Back testing is one of the methods to evaluate the effectiveness of market risk measurements calculated using the VaR method that compares VaR and amount of losses (we compare VaR with assumptive profits and losses). The number of cases where assumptive losses exceeded VaR is the number of times in which losses exceeded VaR during the corresponding period.

The following table shows stressed VaR figures of our trading activities:

	For the six months ended September 30, 2013	For the fiscal year ended March 31, 2014	(Billions of yen) For the six months ended September 30, 2014
End of period	9.9	12.6	11.3

Edgar Filing: MIZUHO FINANCIAL GROUP INC - Form 6-K

Maximum	15.0	15.3	16.3
Minimum	8.4	8.3	8.5
Average	11.4	11.6	11.5

Stressed VaR method:

Linear risk:	variance co-variance model
Non-linear risk:	Monte-Carlo simulation
Stressed VaR	Simple aggregation of linear risk and non-linear risk
Quantitative standard:	1. confidence interval: one-tailed 99.0%; 2. holding period: 1 day; and 3. historical observation period of one year of significant financial stress (265 business days)

Stressed VaR

The stressed VaR measurement is based on a continuous 12-month period of significant financial stress.

Table of Contents**Outlier criteria**

The following table shows results of calculations under the outlier framework:

	Amount of loss	Broadly-defined capital	(Billions of yen) Loss ratio to capital
As of September 30, 2013	340.8	8,806.6	3.8%
As of March 31, 2014	386.6	8,655.9	4.4%
As of September 30, 2014	448.1	9,167.5	4.8%
Effect of yen interest rate	104.7	n.a.	n.a.
Effect of dollar interest rate	238.6	n.a.	n.a.
Effect of euro interest rate	87.5	n.a.	n.a.

Outlier criteria

As part of the capital adequacy requirements under BIS Regulations, the losses arising from a banking book in hypothetical interest rate shock scenarios under certain stress conditions are calculated and compared with the sum of Tier 1 and Tier 2 capital. If the interest rate risk of the banking book leads to an economic value decline of more than 20% of the sum of Tier 1 and Tier 2 capital, we will be deemed an outlier and may be required to reduce the banking book risk or adopt other responses.

Interest rate shock scenario under stress conditions in outlier criteria

For the interest rate shock scenario used in connection with the calculations under the outlier framework, we generate annual rate fluctuation data for five years derived from daily raw historical interest rate data of the past six years and then apply the actual fluctuation data at a 99.0% confidence level to the shock scenario.
