NEWS RELEASE

January 6, 2004

### DRILLING EXPANDS SIZE AND SILVER GRADE OF NAVIDAD MINERALIZED SYSTEM

IMA Exploration Inc. (IMR-TSX.V) is pleased to announce additional results from drill holes 4 & 5 drilled on Galena Hill at the Company's 100% owned Navidad Project. Highlights include 137 metres (m) grading 117 grams per tonne (g/t) silver from drill hole 4, 83m grading 229 g/t silver from hole 5.

Results from the completed drill holes 6 to 11 will be released as available and the drill crew is now on route to complete the remaining 1,700 m in the Phase 1 program. IMA's Geologists are very excited by the size potential indicated by the results to date. Upon the completion of the Phase 1 program results will be analyzed to prioritize drill targets and to delineate the scope of the Phase 2 drill program.

#### TECHNICAL SUMMARY

Drill hole NV03-04 was drilled to a depth of 287.9m at an angle of -45o and intersected brecciated volcanic rocks containing significant sulphides (principally galena +/- pyrite) from surface to 266.7m. The upper 200.2m of this hole returned an average grade of 92.3 g/t silver and 2.49% lead including 55.1m of 164.3 g/t silver and 2.97% lead from 39.6 to 94.7m (see table below and attached section for complete results). This very long intersection of strongly mineralized rock correlates extremely well with anomalous chargeability values as measured by pole-dipole IP on section 51200E and suggests that much of the remaining 1.3 x 1.6 km chargeability anomaly may be mineralized with galena and associated silver. Partial results from hole NV03-04 were previously reported (see Dec 17, 2003 release).

NV03-05 was drilled to a depth of 217.7m at an angle of -60o and intersected 27.5m of pyritic mudstone before penetrating 125.1m of the same mineralized volcanic breccia cored by hole NV03-04. Length weighted average grades include 229.2 g/t silver and 4.24% lead over 83.0m including 18.3m of 503.0 g/t silver and 11.19% lead. The layered pyritic mudstone is important in that it demonstrates the existence of a restricted basin into which sulphides accumulated (principally pyrite in hole NV03-05) indicating that the Navidad system vented hydrothermal fluids to the paleosurface in a subaqueous environment. This mudstone contains elevated zinc values (0.81% over the entire 27.5m intersection) and strong silver and lead values near its bottom contact where it contains crosscutting stringer veinlets of galena.

Drill holes NV03-04 and NV03-05 were drilled on section 51,160E and were collared 133m apart. Previously announced hole NV03-03 was drilled on the same section and intersected 175.5m of 26.0 g/t silver and 1.35% lead over its entire length. It now appears that NV03-03 was drilled at a shallow angle to the dip of the strata and never crossed the core of the target. Holes NV03-04 and 05 appear to cross the geological units closer to perpendicular and indicate true thicknesses of mineralization of 70 to 140m. Together these three holes indicate a mineralized horizontal width of at least 340m on section 51160E.
